Has your commercial solar system failed?

Re-energize your system with ProHarvest & ProHarvest GenXL.

Many commercial solar structures have considerably aged, and due to system specifications, equipment replacement with OEM materials is costly or simply impossible. A complete system redesign is labor intensive and wastes crucial system components.

What is ProHarvest?

ProHarvest inverters are the perfect choice to retrofit and re-energize your existing system, regardless of age or design of the PV modules. The plug-and-play modular systems accept 600V or 1000V panels and are easy to install at the solar array without the need for additional hardware.

Why choose ProHarvest?

Optimized for commercial rooftop ungrounded solar array applications, the compact, high power ProHarvest inverter reduces your system footprint with a Low Balance-of-Systems. This includes a multitude of installed cost savings, such as: terminated AC and DC wires, integrated measurement equipment for troubleshooting and performance metrics

ProHarvest inverters are hassle-free, with low cost of ownership and a 10 year warranty from OutBack Power; **never worry about annual maintenance, fans, electronics, or orientation requirements.** Available in 208V (5.75kW) and 480V (8kW & 10kW) versions, they are small, lightweight, and rugged, packed into a waterproof NEMA6 enclosure. Power line communications support third party monitoring, site evaluation, BOM, installation support and monitoring services are available from Alpha Technologies Services, Inc.
